## CLEAR BI

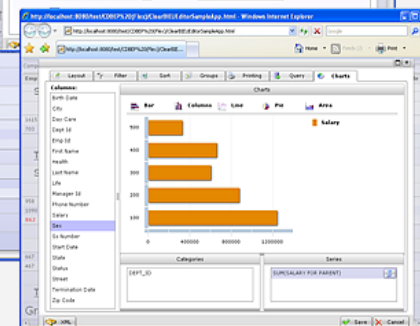

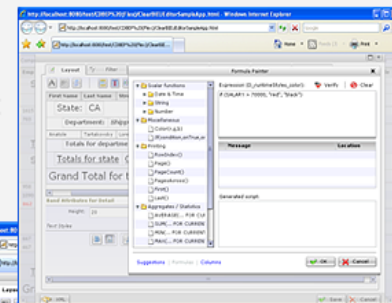

The Only RIA Solution  
for Enterprise Reporting

- Controlled by the Business Users
- Targeted for the Business Users
- Displayed by Flash Player
- Zero Installation on the User's PC
- Allows adding Excel-like formulas
- Users Create Groupings
- Users Modify Presentation
- Prints reports in PDF format
- Exports to Microsoft Excel
- Persist and share reports

Emp ID	Manager ID	First Name	Last Name	Street	City	Salary
1411	100	John	Burns	1 Oakview Terrace	Bedford	\$17,500.00
753	100	John	Myers	221 Washington Street	Westwood	\$15,000.00
Totals for department: Shipping \$300,016						
Totals for state: MA \$3,182,510						
State: TX						
Department: HRSD						
950	100	Thomas	Scott	54 School Street	Houston	\$42,100.00
1980	100	David	Scott	117 Jackson Street	Houston	\$45,400.00
862	100	John	Myers	221 Washington Street	Westwood	\$15,000.00
Totals for department: HRSD \$181,411						
Department: Sales						
441	100	John	Myers	221 Washington Street	Westwood	\$15,000.00
442	100	John	Myers	221 Washington Street	Westwood	\$15,000.00
Totals for department: Sales \$29,000						
Totals for state: TX \$270,711						
Grand Total for the Enterprise: \$3,727,511

- **Mate** by ASFusion
- **PureMVC** by Cliff Hall
- **Clear Toolkit** by Farata Systems

# Getting Employee List

```
<?xml version="1.0" encoding="utf-8"?>
<employees>
  <employee>
    <emp_id>1</emp_id>
    <firstname>Sue</firstname>
    <lastname>Hove</lastname>
    <email>shove@cafetownsend.com</email>
    <startdate>01/07/2006</startdate>
  </employee>
  ...
</employees>
```

```

<?xml version="1.0" encoding="utf-8"?>
<mx:Application xmlns:mx="http://www.adobe.com/2006/mxml" layout="absolute" creationComplete="empService.send()">
    <mx:Panel title="Employee List" horizontalCenter="0">
        <mx:HBox paddingTop="25">
            <mx:Button label="Add New Employee" />
            <mx:Spacer width="100%" />
            <mx:Button label="Logout" />
            <mx:Spacer width="100%" height="20" />
        </mx:HBox>
        <mx:List id="employees_li" dataProvider="{ employees}" labelFunction="fullName" width="100%"/>
    </mx:Panel>

    <mx:HTTPService id="empService" url="assets/Employees.xml" result="employeeDataHandler(event)" />

    <mx:Script>
        <![CDATA[
            import mx.rpc.events.ResultEvent;
            import mx.collections.ArrayCollection;

            //data provider for the list is an ArrayCollection a.k.a. model
            [Bindable]
            private var employees: ArrayCollection=new ArrayCollection;

            private function employeeDataHandler(event:ResultEvent):void{
                employees=event.result.employees.employee;
            }

            // format the names to display last and first names in the List
            public function fullName( empltem : Object ) : String {
                return empltem.lastname + ", " + empltem.firstname;
            }
        ]]>
    </mx:Script>
</mx:Application>

```

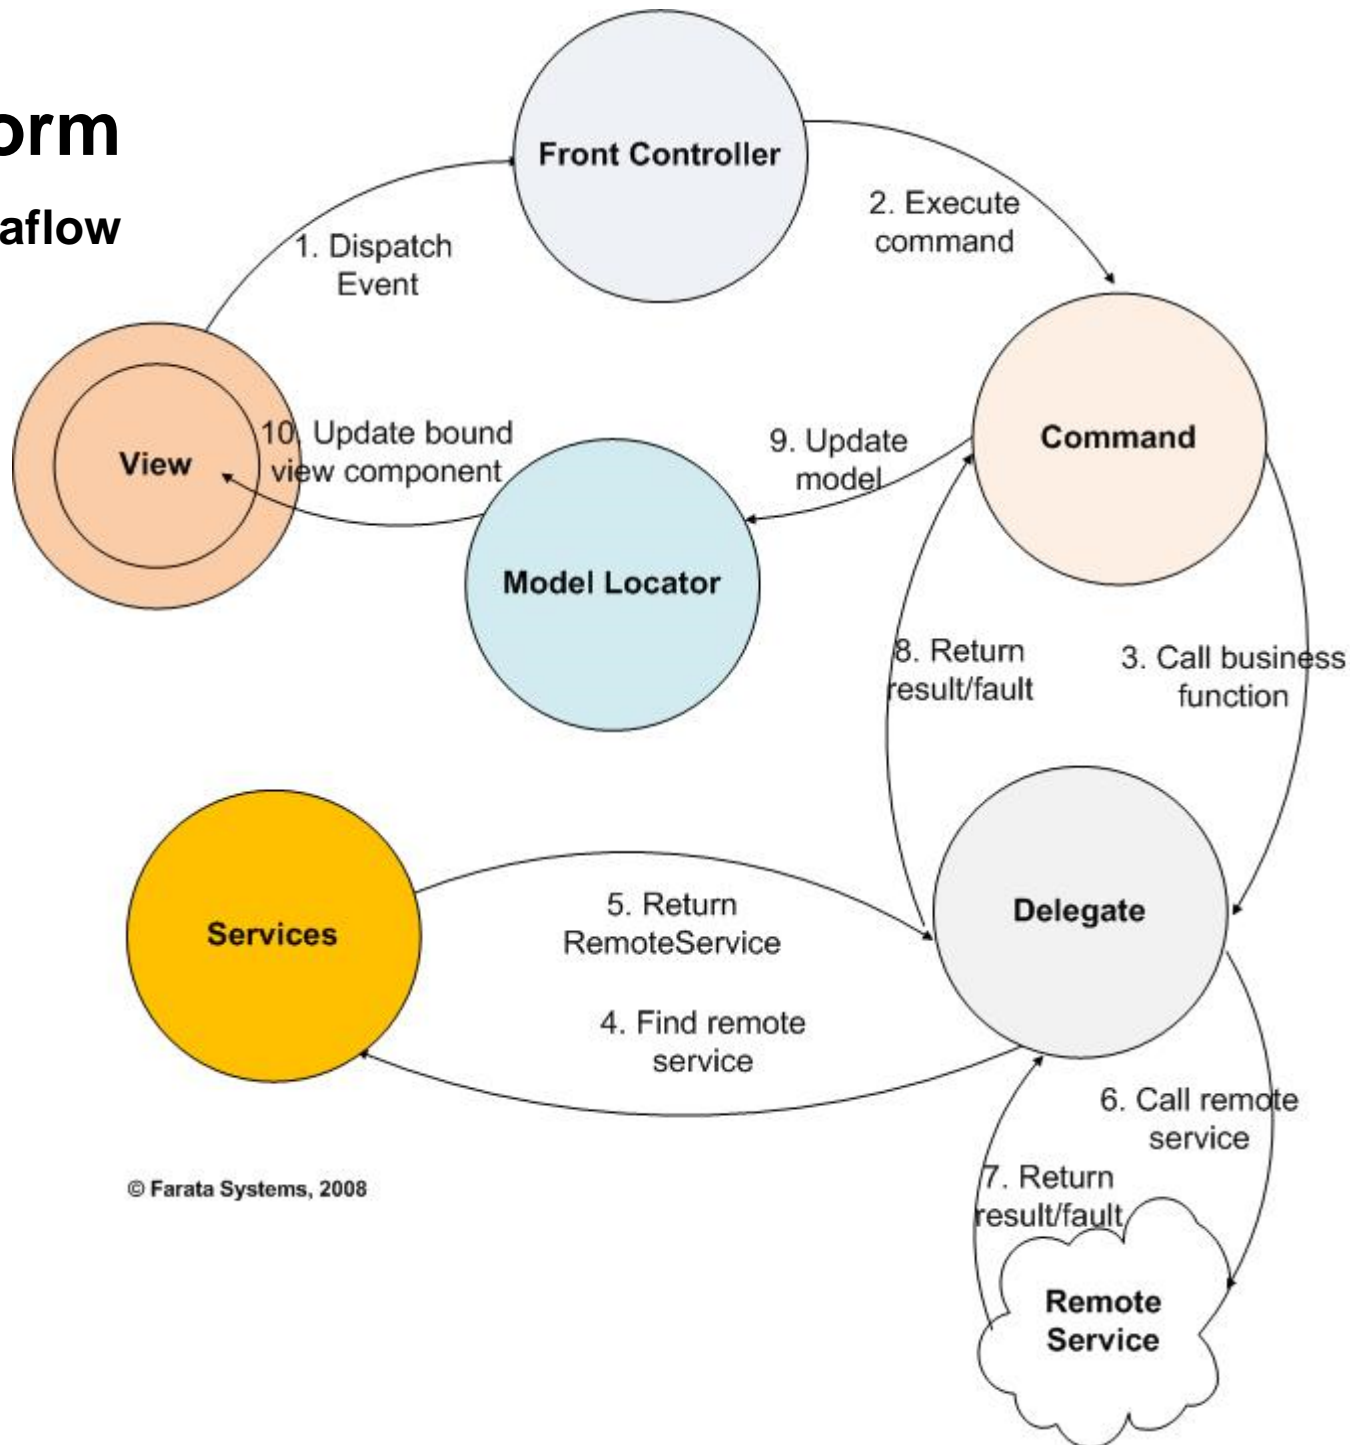

## List of Employees with Flex ( no other frameworks)

# **Code Review**

Café Townsend Cairngorm

# Cairngorm

## Sample dataflow

# Cairngorm: Pros and Cons.

- Pros:**
- It's a popular framework- many Flex developers know it
  - Allows to separate responsibilities of developers
  - Lowers the requirements to the skill-set of developers

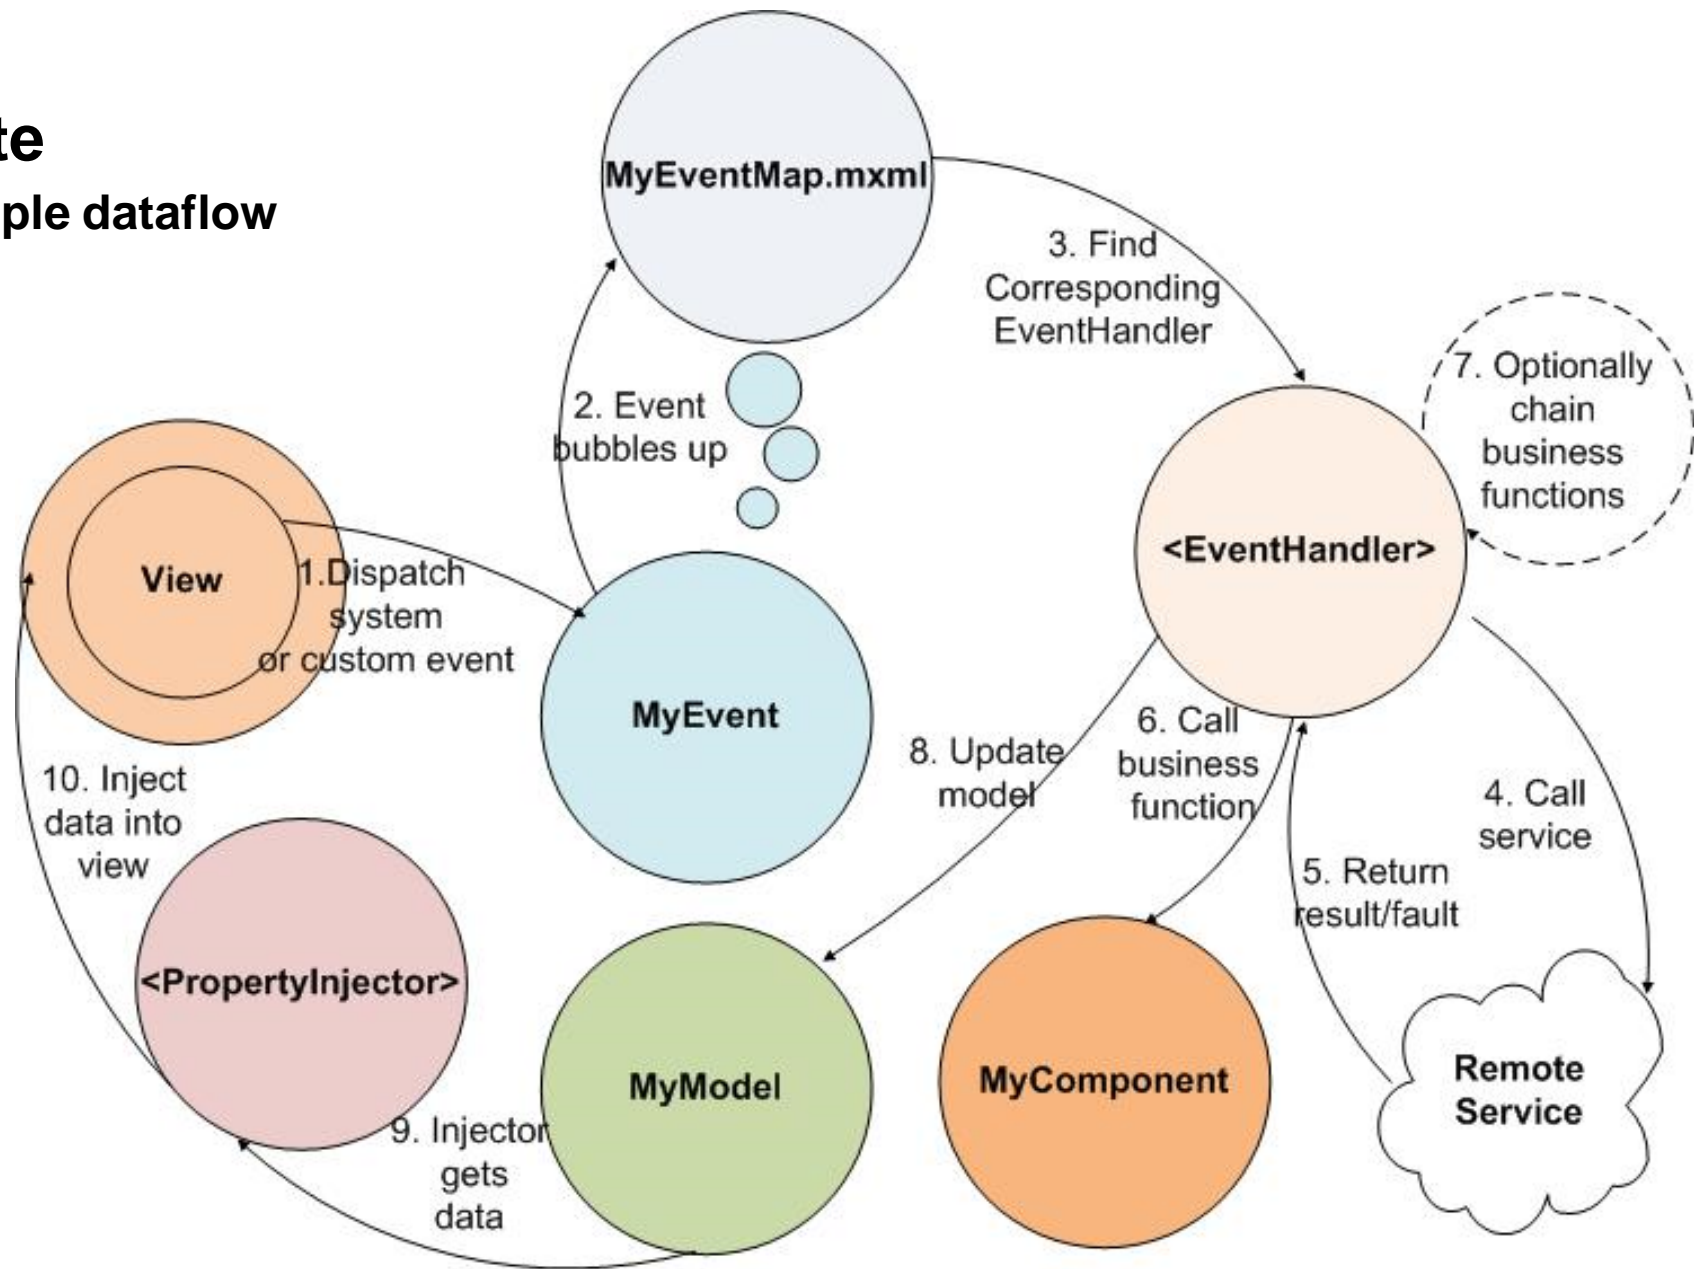

- Cons:**
- Requires developers write lots of additional classes, which adds to project timeline
  - Built on global singletons, which complicates modularization
  - Forces you to use only binding for updating views
  - Allows only one-to-one mapping between events and commands
  - Having several singletons leads to tight object coupling

# **Code Review**

Café Townsend Mate

# Mate

## Sample dataflow

# Mate: Pros and Cons.

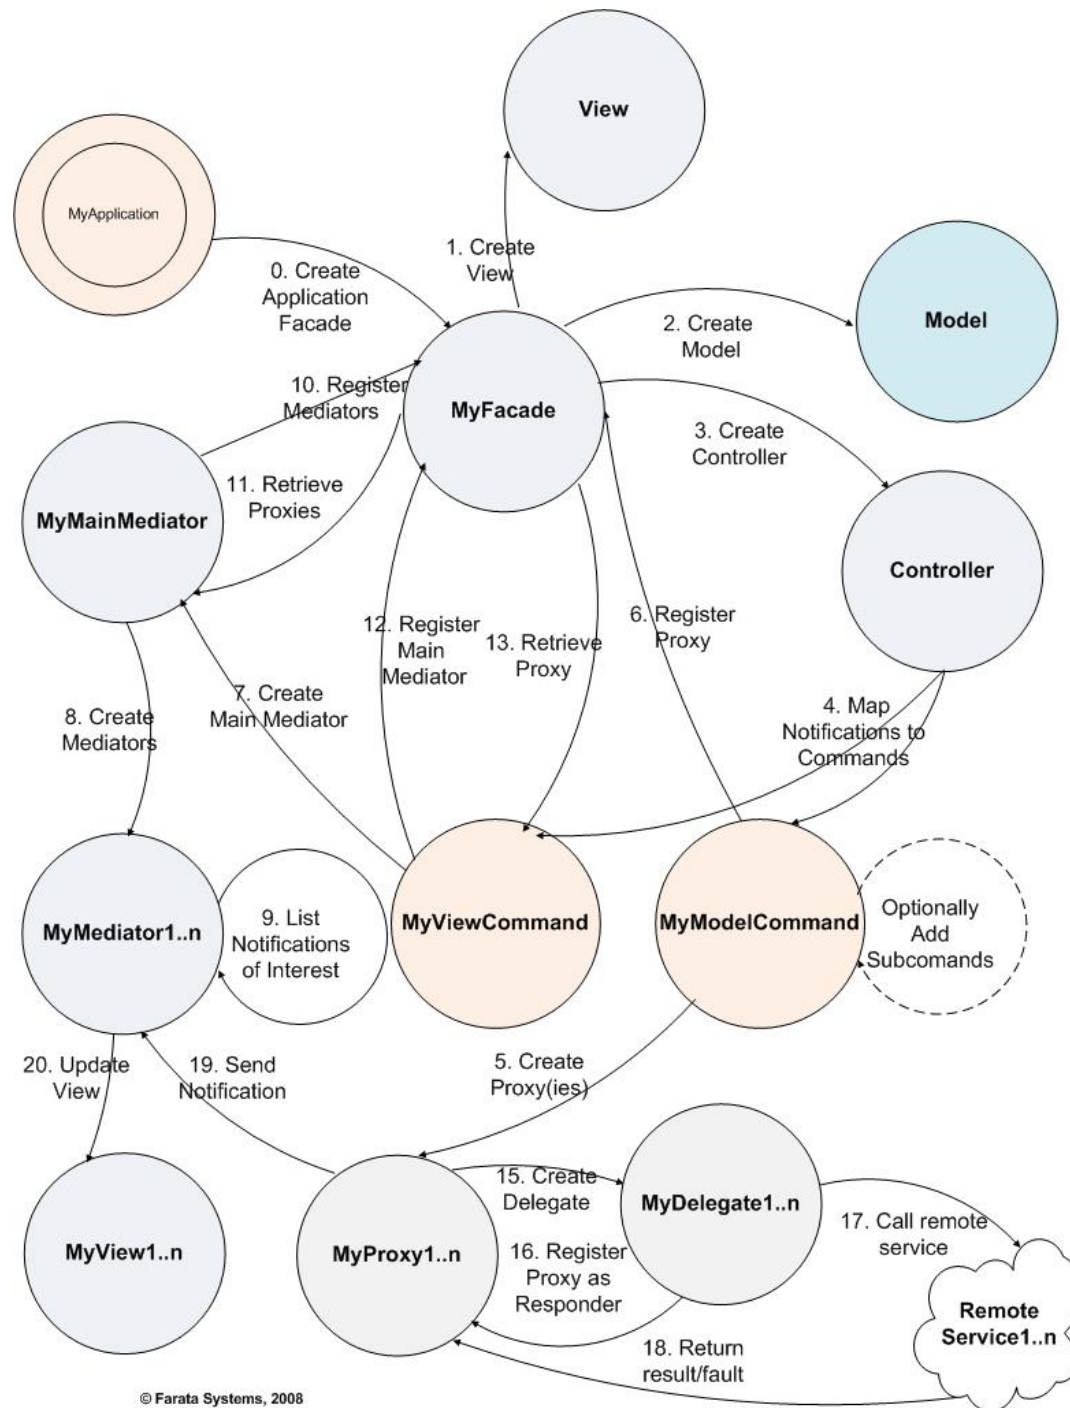

- Pros:**
- Mate is non-intrusive – Mate-specific code can be encapsulated in a handful of objects.
  - It's MXML based and allows you to keep using Flex event model
  - promotes loose coupling between components by implementing Dependency Injection
  - Well documented
- Cons:**
- It hasn't been released yet (currently in Alpha)
  - Doesn't support working with Data Management Services offered by LCDS

# **Code Review**

**Café Townsend PureMVC**

# PureMVC

## Sample dataflow

# PureMVC: Pros and Cons.

- Pros:**
- It's well documented
  - It's available for developers that want to use ActionScript only (i.e. Flash programmers)
- Cons:**
- It's not a framework written for Flex hence does use features offered by MXML
  - Doesn't use standard Flex events
  - Has too many layers, which are tightly coupled
  - Requires staffing projects with more senior developers
  - Developers have to write lots of additional classes, which adds to project timeline
  - It's built on several singletons, and application code becomes cluttered by making multiple calls to them.

# Clear Toolkit 3.0

Library of Components

Clear Data  
Builder

DTO2Fx

Log4Fx

Fx2Ant

ClearBI Reporter

© Farata Systems, 2008

It's **not** an architectural framework, but a set of components that extend Flex framework and tools. It substantially increases productivity of the enterprise Flex developers.

# Clear Toolkit: Pros and Cons.

- Pros:**
- Offers a library of enriched Flex components like super grid, data-aware components, et al
  - Automatically generates a lot of code, which minimizes the amount of code to be written by developers
  - Offers data synchronization functionality in free BlazeDS similar to Data Services from LCDS
  - Its components can be used on as needed basis
  - It offers Web reporting tool for developers and end-users
  - It automates creation of the build scripts in Ant
  - Clear Toolkit is easier to spell than Cairngorm
- Cons:**
- It hasn't been released yet (currently in private Beta)
  - It's not an architectural framework and requires to have a senior architect on the mid-to-large size projects

```

<?xml version="1.0" encoding="utf-8"?>
<mx:Application xmlns:mx="http://www.adobe.com/2006/mxml" layout="absolute" creationComplete="empService.send()">
    <mx:Panel title="Employee List" horizontalCenter="0">
        <mx:HBox paddingTop="25">
            <mx:Button label="Add New Employee" />
            <mx:Spacer width="100%" />
            <mx:Button label="Logout" />
            <mx:Spacer width="100%" height="20" />
        </mx:HBox>
        <mx>List id="employees_li" dataProvider="{ employees}" labelFunction="fullName" width="100%" />
    </mx:Panel>

    <mx:HTTPService id="empService" url="assets/Employees.xml" result="employeeDataHandler(event)" />

    <mx:Script>
        <![CDATA[
            import mx.rpc.events.ResultEvent;
            import mx.collections.ArrayCollection;

            //data provider for the list is an ArrayCollection a.k.a. model
            [Bindable]
            private var employees: ArrayCollection=new ArrayCollection;

            private function employeeDataHandler(event:ResultEvent):void{
                employees=event.result.employees.employee;
            }

            // format the names to display last and first names in the List
            public function fullName( empltem : Object ) : String {
                return empltem.lastname + ", " + empltem.firstname;
            }
        ]]>
    </mx:Script>
</mx:Application>

```

**Let's have a moment of silence in memory of slide 6 of this preso.  
Bringing a list of Employees was so simple with Flex framework!**

**Please stand up.**

**List of Employees with Flex ( no other frameworks)**
